

Kaspersky Endpoint Security 8 for Smartphone

Kaspersky Endpoint Security 8 for Smartphone protects confidential data on corporate mobile devices from loss, theft, unauthorized access and mobile malware.

Today, a lot of companies need their employees to be online not only in the office but also on the move, and that usually means via a corporate smartphone. Calls, messaging, email, access to corporate network resources and the Internet – smartphones provide complete pocket-sized connectivity. Huge amounts of valuable, business-related information may be stored and processed on a mobile device, and this means that smartphones make attractive targets for criminals, leading to corporate data leakage, unauthorized access and malware infection.

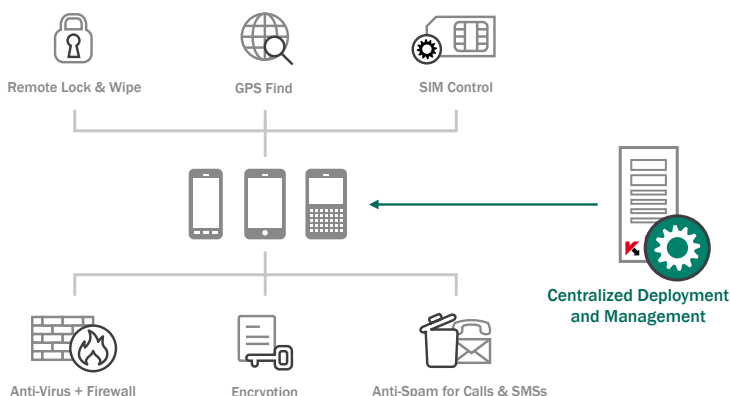

Smartphones are small and that makes them easy to lose or steal. Many mobile devices are left on tables in restaurants and cafes, in taxis and on aircraft, or are stolen from busy places. Each of these devices may store sensitive corporate emails, customer contact details and financial reports and analyses, as well as personal data like mobile banking details and more.

Mobile devices are often not protected from mobile malware as this threat is not as well publicized as PC malware, and is thus frequently ignored. This can be dangerous as malware exists for every major smartphone platform. It can easily infect a user's device and start secretly sending SMSs to premium rate numbers, thus stealing money from the user's mobile account, while other programs are designed to secretly collect user details for the purposes of fraud.

The risks associated with leaving corporate smartphones unprotected include:

- Corporate data leakage if the smartphone is lost or stolen
- Corporate data misuse in the event of unauthorized smartphone access
- Mobile malware and fraudulent software attacks

Kaspersky Endpoint Security 8 for Smartphone is designed to fully close these loopholes. It can remotely connect to a device and protect it if it is lost or stolen, securing it against malicious and fraudulent software and encrypting the valuable data on it.

ABOUT KASPERSKY LAB

Kaspersky Lab is the world's largest privately-owned Internet security company. Our products provide complete protection for home users, mobile users, small-to-medium sized businesses and large enterprises against all forms of IT threats such as viruses, spyware, hacking and spam. Our solutions currently protect more than 250 million systems around the globe. Kaspersky Lab technology is also incorporated inside the products and services of approximately 100 of the industry's leading IT, networking, communications and applications vendors.

ADVANTAGES

- Award-winning anti-theft, encryption and antivirus **protection**
- Easy over-the-air **deployment** using native or third-party mobile device management systems
- Advanced settings and restrictions **management** – via Kaspersky Administration Kit, Sybase Afaria or Microsoft® System Center Mobile Device Manager
- **Most popular smartphones** are supported – Nokia, BlackBerry and Windows Mobile® devices

How does Kaspersky Endpoint Security 8 for Smartphone help to secure mobile users?

- **Anti-Theft.** Remote smartphone lock, wipe and GPS tracking – in the event that the device is lost or stolen
- **SIM-Watch.** Even if the thief changes the SIM card – all the remote functionality remains intact and the new phone number is sent to the real owner
- **Encryption.** Files, folders and memory cards can be encrypted and access to them can be password-protected
- **Anti-Virus.** Real-time protection, on-demand and scheduled scans, automatic over-the-air antivirus database updates
- **Anti-Spam for Calls & SMSs.** Unwanted calls and messages can easily be filtered out
- **Privacy Protection** for hiding communication histories with particular contacts, including contact book entries, call logs and SMSs

Deployment

Kaspersky Endpoint Security 8 for Smartphone can be smoothly rolled out to multiple devices – remotely and over-the-air. Installation is 100% seamless, without user involvement or disturbance

The product can be deployed and managed using...

- Microsoft® System Center Mobile Device Manager
- Sybase Afaria
- Kaspersky Administration Kit

Management

With Kaspersky Endpoint Security 8 for Smartphone, IT departments have full control over remote product installation. IT staff can define which features are enabled or disabled, which settings end-users may configure and which they may not, set the download schedule for antivirus updates, etc. Different policies can be applied to different groups of users. Policies are seamlessly synchronized over-the-air.

Administrators can configure:

- **Anti-Virus:** which types of files to check and which not to, actions on malware detection (delete, quarantine, log or ask the user) and the setting of antivirus update schedules
- **Anti-Theft:** which Anti-Theft components are enabled or disabled (Block, Data Wipe, GPS Find, SIM-Watch), which emails and numbers are used for notifications if a problem arises, as well as the detailed settings of each component
- **Encryption:** which folders should be encrypted
- Whether Anti-Spam for Calls, SMSs and Privacy Protection is enabled or disabled, as these features are more for user convenience than for corporate security needs
- How often the product should synchronize with the management server

For all the above settings, IT staff can prohibit or allow users to change the configuration set by a security policy.
